

Week 09 Progress Report

A weekly progress report summarizes accomplishments, challenges, and upcoming tasks, promoting transparency and accountability. It outlines work completed, milestones achieved, obstacles faced, and plans for next steps to keep stakeholders informed and aligned with project goals.

Details:

- Name of Student: Sparsh Maske
- PRN: 22070521119
- Name of Industry: Electro Era
- Reporting Week: Mention Dates (09/02/2026 to 13/02/2026)
- Institute Mentor Name: Dr. Pawan Verma
- Industry Mentor Name: Sarang Shastrakar

Overview of a Week:

This week focused on stabilizing the core event-driven workflow in the web-based visitor monitoring system. The major objective was to connect event scheduling, live camera feed initialization, and backend detection/recognition execution under a single controlled flow.

Key Accomplishments:

Event Scheduler and Workflow Activation:

- Integrated event creation after login with event name, start time, end time, and camera source selection.
- Linked event activation with detection pipeline start so processing runs only for active events.
- Added event state handling for idle, active, and completed transitions.

Frontend-Backend Integration:

- Resolved API integration gaps between control panel pages and backend endpoints.
- Improved camera list/event state loading and error handling during refresh.
- Stabilized role-based updates in dashboard and visitor log pages.

UI/UX Improvements:

- Upgraded control panel styling for better visual consistency.
- Added dark mode support and corrected navigation labels (football trends to trends).
- Improved section spacing/readability for operational pages.

Challenges Faced:

- Event scheduler initialization errors and camera source fetch failures.
- Temporary backend disconnect behavior after page refresh.
- Validation mismatch between frontend forms and backend required fields.

Plan for Next Week:

- Strengthen staff recognition before visitor ID creation.
- Improve report generation reliability and PDF content correctness.
- Validate tilt and other face-quality checks end-to-end.
